Preface	iii
Contents	v
Introduction	1
Some questions you may have about this book	2
Some thoughts for teachers	10
Part I Topology, and the Brouwer Fixed-Point Theorem in Two Dimensions	15
1 Getting Started	17
1.1 Sets	19
1.2 Logical statements and notation	30
1.3 Quantification: “for all” and “there exists”	34
1.4 Proving implication and equivalence	38
2 Topological Spaces	47
2.1 Closure operators and topological spaces	53
2.2 Examples of closure operators	56
2.3 Some basic facts, notation, and terminology	61
3 A Somewhat More Formal Introduction	65
3.1 Symbols and mathematical language	67
3.2 Results and their statements	69
3.3 Deduction, proof, and formalization	71
3.4 Foundational and descriptive axioms	75
3.5 Axioms: the good, the bad, and the ugly	78
3.6 Proof by contradiction	81
3.7 The contrapositive	83
4 Some Things You Should Know	87

Contents

4.1	Negation of quantifiers, De Morgan's laws, and truth tables	89
4.2	Complements and truth sets	93
4.3	Safe sets: power sets and cartesian products	96
4.4	Relations	98
4.5	Functions	99
4.6	More on cartesian products	106
4.7	Identification and equivalence relations	108
5	Infinities	115
5.1	Arbitrary unions, intersections, and induction	117
5.2	Small is beautiful	124
5.3	Complements, duality, and open sets	129
5.4	*An alternative characterization of topological spaces, which no one uses	131
5.5	*The customary definition of "topological space"	134
6	Numbers and Their Properties	139
6.1	Properties of the real numbers	148
	Algebraic axioms	149
	Order axioms	151
	The least upper bound property	152
6.2	All of familiar algebra follows from the axioms	154
6.3	Absolute value	159
6.4	The natural numbers, \mathbb{N}	161
6.5	The integers, \mathbb{Z}	169
6.6	The rational numbers, \mathbb{Q}	172
6.7	Definition by induction (recursion)	175
6.8	Intervals	179
6.9	The Archimedean property	182
6.10	Orphan problems	187
7	The Metric Closure Operator	191
7.1	Metric spaces	193
7.2	Distance in \mathbb{R}^n	196
7.3	The triangle inequality for the Euclidean metric	199
7.4	The metric closure operator	205
7.5	Examples and applications	211
7.6	Balls and open sets	215
7.7	Open neighborhoods	218
7.8	*Interior, exterior, and boundary	220
8	More About Functions	225
8.1	Composition of functions	229
8.2	Injections, restrictions, and extensions	230
8.3	Range and surjections	231
8.4	Inverse functions and one-to-one correspondences (bijections)	233
8.5	Functions and order	236

Contents

8.6 Induced set functions	238
9 Continuous Functions	241
9.1 Continuity defined	244
9.2 Another characterization of continuity	248
9.3 Continuity in metric spaces	251
9.4 Continuity and cartesian products	255
9.5 New continuous functions from old	261
10 Completeness of the Real Numbers	269
10.1 The principle of nested closed intervals	275
10.2 The intermediate-value theorem and the bisection method	277
10.3 *The decimal expansion principle	281
10.4 *Equivalent formulations of completeness for \mathbb{R}	287
10.5 *Connectedness	289
10.6 *The Cantor set	296
11 Convergence	303
11.1 Convergence and limits	306
11.2 Subsequences	310
11.3 Sequential compactness	312
11.4 *Infinite series	320
11.5 *Completeness for metric spaces	329
11.6 *The contraction mapping theorem	331
11.7 *Compactness	333
12 Brouwer's Theorem in Two Dimensions	339
12.1 The proof	342
12.2 A combinatorial lemma	344
12.3 Proof of the combinatorial lemma	346
13 Topological Equivalence	353
13.1 Homeomorphisms	356
13.2 Topological invariants	363
13.3 The fixed-point property and conjugacy	364
13.4 $[0, 1]^2 \approx B^2$	368
13.5 *Cantor spaces	371
Part II Foundations	377
14 Propositional Logic	379
14.1 Symbols and logical formulas	380
14.2 Valuations and truth	384
14.3 Proofs	385
14.4 Subproofs	388

Contents

14.5 Indirect proofs and turnstile notation	390
14.6 Soundness	394
14.7 Completeness of propositional logic	396
15 First-Order Logic	401
15.1 Formal theories and axioms	401
15.2 Syntax in first-order logic	408
15.3 Interpretations, Truth Values, and Models	410
15.4 Substitution, and two rules for quantifiers	415
15.5 Loose variables, and the other two rules for quantifiers	416
15.6 Rules for equality	419
15.7 Proofs in first-order logic, and soundness	419
15.8 Completeness of first-order logic	423
16 Axioms for Set Theory	431
16.1 Sets and the axiom of extension	432
16.2 Russell's paradox and the axiom of specification	432
16.3 An interlude on being and nothingness	434
16.4 The pair axiom and ordered pairs	434
16.5 Subsets, set operations, and the union axiom	435
16.6 Power sets, the power set axiom, and cartesian products	437
16.7 Functions and relations	438
16.8 Peano arithmetic and the axiom of infinity	439
16.9 Two "final" axioms	442
16.10 The axiom of choice	444
17 Recursion and Arithmetic	447
17.1 Recursion	447
17.2 The uniqueness of \mathbb{N}	449
17.3 Arithmetic in \mathbb{N}	452
17.4 Order in \mathbb{N}	455
17.5 Well-ordering and strong induction	458
18 Finite and Infinite Sets	463
18.1 Finite sets	463
18.2 Counting	465
18.3 Countable sets	469
18.4 Smaller infinity, bigger infinity	472
19 Construction Zone: Numbers	477
19.1 Constructing the rational numbers from the integers	477
19.2 Constructing the integers	481
19.3 Constructing the real numbers	482
Dedekind cuts	483
Addition of Dedekind cuts	486
Ordering of Dedekind cuts	488

Contents

Multiplication of Dedekind cuts	489
19.4 Uniqueness of the real numbers	491
19.5 Other constructions of the real numbers	491
19.6 Constructing the complex numbers	491
20 Trouble in Paradise	493
20.1 Crises in the Foundations of Mathematics	493
20.2 Gödel's terrible swift sword	495
20.3 Wait, what?!	499
20.4 Other things we can't prove	500
20.5 Valedictory	502
Appendices	505
A Things Mathematicians Do	507
B Letters and Symbols	511
Index	517
